A world first shower that can save 82% water – every shower

Quench Solutions Pty Ltd has announced the release of a 'world first' home shower system that can reduce the daily water consumption by as much as 82% (approximately 200,000 litres per annum in a busy household).

Developed in Australia, the QUENCH SHOWER relies upon only 4 litres to provide a continuous shower – for as long as you like!

"We all take water for granted. Its only when water levels reach crisis point that any action is taken. We decided to develop a product that everybody uses daily – that will save enormous amounts of water – and people will thoroughly enjoy. It is hard to get people to stop doing something they enjoy so much – and taking long showers is a prime example". says Brian Gay, Managing Director of Quench Solutions Pty Ltd.

"The QUENCH SHOWER allows you to shower normally. You can soap up, wash your body and rinse off in a couple of minutes – then using 4 litres of fresh, temperature-controlled water – shower as long as you like. We have designed the QUENCH SHOWER as a complete shower cubicle that is straight forward to install in your bathroom, and easy to operate.

It is a high performance, reliable system that has the ability to save as much as 82% of your current water usage in the shower. That can represent around 200,000 litres per annum in a busy household. Considering that around 250,000 new homes are built annually in Australia and a further 450,000 homes renovated – the water saving capability is mind blowing!"

The QUENCH SHOWER is affordable, looks stunning and, more importantly, it is a way for people to contribute immediately to the environment and save valuable water in our drought-stricken country.
